

# *Underrepresented Populations* in the Genetic Association Database (GAD)

Jessica Meng  
Khoury College of Computer Science '28

To start, I want to emphasize that the information in the GAD is incomplete. Most data entries do not have a population listed. On top of that, entries that do have populations listed are not standardized, making data usage difficult.

With that being said, the most underrepresented populations from the data I gathered are African, Middle Eastern, and Hispanic/Latino populations. While disappointing, this is the result I expected. Research represented in the GAD primarily focuses on Caucasian and Asian populations, which limits the generalization of the findings to the global community. Also, expanding research in underrepresented populations is crucial for effective medical treatment across all diverse groups.

```

1  • USE gad;
2  -- Which populations are underrepresented in the Gene Association Database?
3  • SELECT population, COUNT(population) AS num_records
4  FROM gad
5  WHERE population IS NOT NULL AND population <> ''
6  GROUP BY population
7  -- Finding most popular populations
8  HAVING num_records > 100
9  -- Finding the populations represented the most
10 ORDER BY num_records DESC;
11 -- However, since the data about population is not standardized
12 -- and the majority is null, this is a difficult question.
13 -- That is why I have decided to focus on this topic: I believe it highlights
14 -- information that the GAD can improve upon, and I hope to raise awareness of it.
